

ROYAL JORDANIAN AIR FORCE

HAWK EYE

The Digital Squadron Operations Ecosystem

One logbook. Every pilot. Every squadron. Every decision — in sync.

WHAT THIS BRIEFING COVERS

A tour of Hawk Eye.

03	What is Hawk Eye	13	Private messages & command inbox
04	The ecosystem — PC, phone, cloud	14	Alerts & notifications — per-PC chime
05	How data travels — and how it is sealed	15	Leave, availability & crew rest
06	Security & privacy — the sealed envelope	16	Reports & exports — one-click RCN forms
07	Defence in depth — what stops an intruder	17	Multi-tier command & guest pilots
08	The PC dashboard at a glance	18	The pilot's mobile app
09	Pilot roster & records	19	Bilingual, offline, backup & settings
10	Sorties & flight logging	20	Before & after — what Hawk Eye replaces
11	Currencies & certifications	21	Closing
12	Schedule sharing — Flight !' Squadron !' Wing !' Base.....		

WHAT IS HAWK EYE?

A single nerve centre for the squadron.

Hawk Eye replaces paper logbooks, spreadsheets, WhatsApp group chats and scattered clipboards with one living system that every pilot and every commander can trust.

From the moment a pilot lands to the moment the wing commander signs off the monthly report, the same data flows across the entire chain — no copy-paste, no lost pages, no guesswork about who has the latest numbers.

**One**

logbook across the whole squadron

Zero

paper forms to lose or forge

Real-time

sync between PC and mobile

24 / 7

availability from anywhere secure

THREE DOORS, ONE ROOM

How the pieces fit together.

Commander's PC

Windows desktop installer used at every squadron, wing and base command post. Full command view, schedule authoring, message inbox, reports.

Pilot's Phone

Android & iOS app for every pilot. Log sorties from the flight line, read alerts from command, track currency, get reminders before certifications expire.

Secure Cloud

A dedicated private database holds the shared state. Every PC and every phone talks only to this cloud — never directly to each other.

THE KEY IDEA

A number entered on any pilot's phone appears on every authorised commander's screen within seconds — and vice versa.

HOW DATA TRAVELS

And how every trip is sealed.

1 Sealed at the source

The moment a pilot taps Save — or a commander sends a message — the data is wrapped in a bank-grade encrypted envelope on the device itself.

2 Carried through the cloud

The sealed envelope travels to a private cloud vault that only Hawk Eye devices can address. Nothing in the middle can read the contents.

3 Opened only where entitled

The other end — the authorised PC or phone — is the only place the envelope is opened, and only the fields that role is allowed to see.

BUILT FOR TRUST

Security & privacy, in plain language.

THE SEALED-ENVELOPE PRINCIPLE

Every piece of information that leaves a PC or a phone travels inside a sealed digital envelope. Only the authorised server can open it. A third party tapping the line would see sealed envelopes — never the letters inside.

- ◆ **Two-factor sign-in** — each super-admin pairs an authenticator app; a stolen password alone is not enough to get in.
- ◆ **Role-based access** — a flight commander sees flight data, a wing commander sees wing data, a pilot sees their own record. Nothing beyond their mandate.
- ◆ **Private by design** — the database is locked down at the server level — even someone with a direct database connection only sees rows their role is entitled to.

WHAT STOPS AN INTRUDER

More than one lock on the door.

- ◆ **Wrong password repeatedly?** the account is frozen for a cool-down window. Brute force is blocked at the door.
- ◆ **Stolen laptop?** the app is locked behind the commander's password; the disk is encrypted; the database is never stored locally in the clear.
- ◆ **Someone taps the line?** they see sealed envelopes, never the letters inside — transport encryption is the same standard banks use.
- ◆ **Someone steals the database?** passwords are stored as one-way fingerprints only; there is nothing there to read back.
- ◆ **A device goes missing?** it can be revoked from the trusted-device list; the next sign-in from that PC is refused.

EVERY ACTION IS SIGNED

Who did what, when, and from which PC is recorded automatically — and cannot be altered by the person who made the change.

FOR COMMANDERS

The Hawk Eye dashboard.

- ◆ **Live KPIs** — monthly hours, sorties flown, pilots available — all on the home screen.
- ◆ **Sortie log & live entry** — add, approve and audit every flight.
- ◆ **Flight schedule authoring** — draft, review and release the next day's plan.
- ◆ **Currency & expiry tracking** — NVG, instrument, tactical, medical — no surprises.
- ◆ **Roster & ranking view** — a league table that keeps the squadron sharp.
- ◆ **Leaves & unavailability** — see who can fly before you assign anyone.
- ◆ **Monthly reports** — RCN Forms 1 – 4 auto-generated, bilingual (EN / AR).
- ◆ **One-click PDF exports** — every view, ready for the wing commander.

Hawk Eye dashboard · sign-in screen

BILINGUAL Full English & Arabic interface, right-to-left aware.

EVERY PILOT, ONE RECORD

The living roster — never out of date.

- ◆ **Central squadron roster** — rank, English/Arabic names, military number, unit assignment (SQDN or HQ Attached).
- ◆ **Pilot dossier** — career totals, qualifications, full sortie history and contact details, on one screen.
- ◆ **Rankings & leaderboards** — sort by hours, sorties, NVG time, mission type — keeps the squadron sharp.
- ◆ **Unit management** — move pilots between units; changes reflect across every view instantly.
- ◆ **Historical CSV import** — bring legacy pilots and sorties in with a guided column-mapping tool.
- ◆ **Archive inactive pilots** — keep the active roster clean while preserving every historical row.

All ranks

from Cadet to Wing Commander, in one list

Arabic & English

names shown side by side on every report

No duplicates

military-number matching catches repeats automatically

EVERY SORTIE COUNTED

Logged once — used everywhere.

- ◆ **One-minute sortie entry** — pilot, co-pilot, mission type, day/night/NVG, seat timings (D1, D2, DD, N1, N2, ND).
- ◆ **Inline edit, duplicate, delete** — the whole squadron log, searchable and filterable.
- ◆ **Automatic validation** — seat timings must add up to total flight time; typos caught before they save.
- ◆ **External & guest pilot logging** — record visitors without adding them to the permanent roster.
- ◆ **Before/after diff** — every edit or deletion shows exactly what changed, side by side.
- ◆ **Shake-to-undo** — accidental delete? a single tap or gesture reverses it.
- ◆ **Pilot's mobile logbook** — every pilot sees their own flight history in their pocket, always up to date.
- ◆ **Auditable for ever** — Hawk Eye never forgets; the wing commander can audit any month, any year.

HOURS THAT NEVER GET LOST

A sortie logged on a pilot's phone at 14:02 is on the commander's dashboard, in the roster totals, and in next month's RCN form — all within seconds.

NOTHING EXPIRES QUIETLY

Day, Night, NVG, IRT, Medical, Simulator.

 CURRENT

ready to fly

 EXPIRES SOON

act this month

 EXPIRED

grounded until renewed

 NOT SET

never recorded; needs data

- ◆ **Squadron-wide currency dashboard** — a single colour-coded board for every pilot, every qualification, every expiry date.
- ◆ **Expired-after look-ahead** — pick a future date; Hawk Eye shows who will fall out of currency by then — perfect for planning.
- ◆ **N/A toggle** — pilots who do not fly NVG (or any category) are excluded cleanly — no false reds.
- ◆ **Fast IRT / Medical renewal** — ops officers update a batch of pilots with two clicks.
- ◆ **Pilot's personal countdown** — every pilot sees their own days-to-expiry on their phone, colour-coded.
- ◆ **Push reminders** — at 30, 14 and 7 days before expiry, the pilot's phone nudges them — before it's a problem.

FROM FLIGHT LINE TO BASE HQ

One schedule, shared up the chain.

- ◆ **Daily mission board** — the live flight line: aircraft, crew, takeoff/landing, mission type.
- ◆ **Four-tier chain** — Flight !' Squadron !' Wing !' Base. Each level can review, edit and approve before passing up.
- ◆ **Change diffing** — when a schedule comes back with edits, Hawk Eye highlights exactly what changed — no hunting through the sheet.
- ◆ **RJAF-style flight sheet** — digital replica of the official A4 landscape schedule, ready to print.
- ◆ **Program defaults** — pre-set airbase, squadron name and standard aircraft types to draft the day's plan in minutes.

ONE VERSION OF TRUTH

No more emailed PDFs or photocopies. Every tier sees the same live schedule — and knows whose turn it is to approve.

A COMMAND-ONLY INBOX

Secure PC-to-PC, priority-tagged.

- ◆ **Private PC-to-PC** — Wing !' Squadron, Squadron !' Flight — text-only, with a full audit trail.
- ◆ **Priority levels** — Normal, High, Very High — and the receiving PC reacts accordingly.
- ◆ **Inbox, Sent, History** — every message kept, searchable, never lost to a WhatsApp scroll.
- ◆ **Read receipts** — the sender sees exactly when the commander on the other end opened the message.
- ◆ **Pilot broadcast** — commanders can push short, urgent notices straight to a pilot's phone.

REPLACES WHATSAPP, BY DESIGN

Command traffic stays inside the chain of command — not in a consumer chat app outside your control.

WHEN IT MATTERS, YOU HEAR IT

Per-PC alerts with sound & pop-up.

A commander shouldn't have to stare at the screen to catch an incoming order. When a message, a schedule, or a cross-squadron approval lands on a specific PC, Hawk Eye:

- ◆ **Plays an unmistakable tone** on the receiving PC's speakers.
- ◆ **Flashes a clear pop-up** with the sender, the subject and a preview.
- ◆ **Fires a Windows notification** that surfaces even when another app is on top.

ONLY THE RIGHT PC CHIMES

Other command posts stay silent — a wing PC does not chime when a squadron sends a schedule to a different wing, other squadrons do not chime on pending rows that are not theirs, and the sender is never alerted on their own copy. Signal, not noise.

WHO CAN FLY TODAY?

Leave, crew rest & unavailability.

- ◆ **Daily availability** — mark each pilot Available, on Leave, Sick, Crew Rest or any custom category, for a specific date.
- ◆ **Custom leave types** — squadrons can add their own categories with chosen colours.
- ◆ **Weekly / monthly totals** — leave days per pilot aggregated for long-range planning and Form 3.
- ◆ **Unavailability list** — pilots out of the squadron today are flagged and excluded from scheduling.
- ◆ **Leave requests from the phone** — a pilot submits a request; the commander approves on the PC — no paper form.

Zero assignment mistakes

The schedule form refuses to roster a pilot who is on sick leave today.

Form 3 in seconds

The monthly leave summary rolls up automatically from the daily availability.

History never lost

Leave history stays with the pilot's record for every future audit.

ONE CLICK TO THE SIGNED FORM

RCN Forms 1 – 4, PDFs, Excel.

- ◆ **Monthly report wizard** — auto-fills ORFG RCN Forms 1, 2, 3 and 4 from logged sorties and daily availability — no typing.
- ◆ **One-click PDFs** — Authorization, Roster, Currency, Cycle, Risk and Totals reports with the RJAF emblem header.
- ◆ **Bilingual output** — generate the same report in English, Arabic, or side-by-side bilingual.
- ◆ **Excel & CSV exports** — hand the sortie log or roster to any spreadsheet tool for one-off analysis.
- ◆ **Mobile logbook export** — a pilot can save a JSON copy of their personal flight history as a backup.
- ◆ **Arabic-Indic digits** — printed Arabic reports use the correct numeric glyphs.

BUILT FOR THE CHAIN OF COMMAND

Squadron, Wing, Base — with guests.

- ◆ **Role-based views** — Flight Commander, Squadron Commander, Wing, Base and HQ each see the tools they need — and nothing they shouldn't touch.
- ◆ **Multi-squadron view** — Wing and Base commanders get a high-level readiness board for every squadron under their command.
- ◆ **Guest pilot backfill** — when a visiting pilot flies with your squadron, the sortie lands as 'Pending Approval' on their home squadron's PC — automatically.
- ◆ **Military-number matching** — guest sorties match the right pilot even across squadrons, regions and languages.
- ◆ **Guest seat cascading** — once the home squadron accepts, the hours credit the correct pilot's record in a single step — no phone calls, no lost hours.
- ◆ **Terminal role lock** — a terminal can be pinned to its role (e.g. 'Ops PC') so no one can silently change its scope.

FOR PILOTS

The logbook in every pilot's pocket.

- ◆ **Log a sortie in under a minute** — taxi-out, taxi-in, mission type, remarks.
- ◆ **My hours, my currencies** — always up-to-date, at a glance.
- ◆ **Incoming alerts from command** — priority-tagged, impossible to miss.
- ◆ **Smart reminders** — before NVG, instrument or medical expire.
- ◆ **Leave requests** — submit from the field, commander approves on PC.
- ◆ **Push notifications** — audible heads-up the moment a new order goes out.
- ◆ **Auto-unlock on cold launch** — trusted phone returns to ready instantly — no password on every open.
- ◆ **Works in English & Arabic** — full right-to-left layout.
- ◆ **Android & iOS** — the same login, the same data, either device.

DESIGNED FOR THE SQUADRON

Bilingual, offline-tolerant, backed up.

Bilingual EN / AR

Instant language toggle. UI layout flips automatically; pilot names and mission remarks can be entered in either script.

Offline tolerant

If the network drops mid-sortie, entries queue safely on the PC or phone and sync the moment the connection returns.

Live sync indicator

Every PC shows Online / Syncing / Offline — the operator always knows whether what they entered has reached the base.

Squadron setup

Squadron Name, Number and Base drive every report header — configure once, correct for ever.

Backup & restore

Create password-protected .rjafbackup files locally — a second copy outside the cloud, held by the squadron.

Light & dark themes

High-contrast mission colours for day operations; a darker palette suited to night-shift eyes.

FROM PAPER TO HAWK-EYED

What Hawk Eye replaces.

YESTERDAY

Paper logbooks in a drawer

WhatsApp groups for schedule changes

Manually typed monthly reports

Forgotten currency expirations

Guest-pilot hours lost between squadrons

Phone calls to confirm the latest schedule

Scattered leave slips

WITH HAWK EYE

A live, searchable electronic logbook on every device.

Private PC-to-PC messages, audited and priority-tagged.

Auto-generated RCN Forms 1 – 4, bilingual, PDF-ready.

Reminders before each pilot's next expiry.

Automatic cross-squadron approval flow.

Shared schedule chain — everyone sees the same version.

One daily availability board feeding the monthly Form 3.

H A W K E Y E

Sharper eyes. Stronger squadron.

Every sortie counted. Every pilot ready. Every commander informed.

Windows Desktop

Android & iOS

Bilingual EN / AR

Two-factor login

Encrypted end-to-end

Full audit trail

Offline-tolerant

Guest-pilot aware
